Write-Up

Proskey is a pitchability-oriented right-hander whose success is built around command, shape diversity, and an advanced understanding of how to sequence his arsenal. The profile lacks premium velocity, but he consistently attacks hitters with four distinct offerings and demonstrates enough strike throwing to project as a starter. The curveball is the current carrying pitch, though the splitter provides additional upside if the usage expands moving forward.

The FB features nearly 21 inches of IVB and above-average ride characteristics, though the overall projection is capped by modest velocity. The pitch enters the zone with a -4.77 VAA which is better than average for his high release and possesses enough carry to generate swings above the barrel when elevated. Proskey throws the pitch over half the time and demonstrates confidence attacking hitters in the strike zone. The shape is strong, but the lack of velocity suppresses the overall grade and forces the pitch to rely heavily on command. It profiles as a fringe-average professional fastball that plays best when located in the upper third. 40/45+ pitch.

The CT functions as a bridge pitch between the FB and CB. The shape is relatively neutral, with minimal lateral movement and modest depth and shape-wise profiles more as a gyro slider. Proskey primarily uses the pitch to change speeds and create different visual looks rather than generate swing-and-miss. The strike throwing is solid and the pitch fills an important role within the overall

arsenal, but the underlying shape points toward more of a supporting piece than an impact professional offering. 40/45+ pitch.

The CB is the best pitch in the arsenal. Featuring substantial depth, quality spin, and a steep approach angle, the pitch generated both strong whiff and chase numbers throughout the season. Proskey consistently landed the pitch in the strike zone early before burying it beneath the zone to finish hitters. The shape is comfortably above average and the results support the projection, with a 32.4% whiff rate and nearly 36% CSW. It projects as a reliable professional breaking ball. 50/55+ pitch.

The SPL was used sparingly but flashed intriguing traits. The pitch generated a 40% whiff rate and provided a movement profile distinct from the rest of the arsenal. The usage remains limited, making aggressive grading difficult, but the shape and results suggest there is additional value available if Proskey continues to develop confidence in the pitch. Increased usage would also strengthen his ability to navigate left-handed hitters multiple times through an order. 40/45+ pitch.
