Write-Up

Queen possesses one of the more unusual repertoires in the class, relying primarily on a velocity-oriented slider and a true downer curveball rather than building the profile around the fastball. The arsenal attacked hitters from multiple movement planes and generated elite swing-and-miss metrics throughout the season. While the command profile remains a developmental point, the quality of both breaking balls creates a high floor and gives Queen a legitimate chance to impact hitters at the professional level.

The FB is an intriguing pitch despite not serving as the primary carrying offering. Averaging 92.1 mph with nearly 19 inches of IVB and almost 12 inches of HB, the pitch features strong movement characteristics. The -4.89° VAA is closer to your average bucket than true carry territory, limiting how much the raw ride ultimately plays. Queen generated modest swing-and-miss with the FB and primarily used it to set up the breaking balls. The shape is solid, but the command and results trail the raw characteristics. 45/50+ pitch.

The CB is a legitimate weapon. Featuring over 16 inches of depth and quality glove-side movement, the pitch generated a 49.1% whiff rate, 18.1% SwStr rate, and over 50% CSW. The shape is comfortably plus and Queen showed the ability to both land it for strikes and expand beneath the zone. The pitch consistently missed bats and served as one of the primary reasons hitters struggled to square him up. 55/60+ pitch.

The SL is the best pitch in the arsenal and one of the better breaking balls in the dataset. Despite being labeled a slider, the pitch behaves more like a velocity-oriented deathball, maintaining excellent

firmness while generating elite results. The pitch produced a 49.7% chase rate, 60.3% whiff rate, 31.6% SwStr rate, and over 50% CSW. Just as importantly, Queen demonstrated confidence throwing it to both handedness groups and used it as his primary put-away pitch. The shape itself is not overwhelming, but the velocity, execution, and results allow it to play comfortably above the raw movement profile. 60/65+ pitch.

The CH was rarely utilized, making projection difficult. The underlying movement profile is encouraging, generating substantial fade and enough separation from the FB to create another look against opposite-handed hitters. The long-term starter viability of the profile would benefit from increased confidence in the offering, though the current sample is too small for a firm evaluation. 35/45+ pitch.
