

Top 12 Right Handed Arms in the 2027 Draft

One of the most difficult parts of evaluating the 2027 class was separating the right-handed pitchers from one another. The group contains elite stuff, proven workloads, professional-quality secondaries, and an unusually large number of viable starter profiles.

At the top of the board are pitchers who already look the part of future professional rotation anchors. Dax Whitney pairs premium velocity with one of the deepest arsenals in the country. Chris Levonas succeeds through a combination of command, pitchability, and one of the most complete repertoires in college baseball. Sam Cozart emerged as one of the premier freshman arms in the nation despite working primarily in relief, while Ryan McPherson and Aidan King built their cases through a blend of production, command, and polished starter traits.

What makes the class especially challenging to sort through is the variety of profiles. Some pitchers win through overpowering velocity and elite movement characteristics. Others rely on sequencing, command, and arsenal depth. There are power relievers with starter upside, pitchability arms capable of turning lineups over, and several pitchers whose carrying tools rival those of the most highly regarded arms in the country.

The middle tiers of the class remain particularly impressive. Players such as Wylan Moss, Will Sanford, Duke Stone, Sean Jenkins, and Tanner Bradley all arrive at professional value through completely different pathways. Some possess elite offspeed offerings. Others feature dominant fastballs or unusual release characteristics. Few draft classes offer this many distinctly different routes to success among their right-handed pitchers.

Ultimately, the challenge with this group is not identifying talent. It is determining how to separate pitchers who all possess realistic professional futures. The differences between these arms often come down to starter probability, workload certainty, and long-term projection rather than talent alone.

These are my Top 12 right-handed pitchers entering the 2027 season.

Number 12: Tanner Bradley, Oregon

2026 Stats: 1.66 ERA | 59.1 IP | 90 K | 18 BB

Best Pitch: Changeup (60/65)

Bradley rounds out this list because he possesses one of the most unique carrying pitches in the entire class. While several pitchers ranked above him offer louder fastballs, deeper arsenals, or more traditional starter profiles, few can match the impact of Bradley's changeup. The Oregon right-hander built his success around movement, deception, and one of the best offspeed pitches in college baseball.

The changeup is the engine of the entire profile. Generating over 21 inches of arm-side movement while also producing negative induced vertical break, the pitch creates an unusual movement pattern that hitters rarely encounter. The result is an offering capable of generating elite swing-and-miss while simultaneously disrupting timing and forcing consistently poor contact. Unlike many developmental changeups, Bradley already demonstrates complete confidence throwing it in any count and against either handedness.

The rest of the arsenal supports the changeup well. The sinker establishes the lower half of the strike zone and generates ground balls, while the sweeper attacks a completely different movement plane. Together they create enough diversity to keep hitters from sitting on the changeup, but there is little doubt which pitch drives the profile. When Bradley needs a strikeout, the changeup is the answer.

What keeps him from ranking higher is starter certainty. Several pitchers above him possess more complete repertoires, stronger workloads, or a more traditional path toward remaining in a professional rotation. Bradley's profile is anchored heavily by one exceptional pitch, and continued development of the supporting arsenal will determine how high the ceiling ultimately climbs.

Why #12: Bradley makes the list because elite carrying pitches matter. The changeup is arguably the best offspeed offering in the class and gives him a weapon capable of generating outs against hitters at any level. The pitchers ranked above him offer stronger overall profiles, but few possess a single pitch as dominant as Bradley's changeup.

Number 11: Easton Hawk, UCLA

2026 Stats: 1.93 ERA | 42.0 IP | 1.143 WHIP | 52 K | 19 BB

Best Pitch: Slider (55/60+)

Hawk finds his way onto this list because few pitchers in the class can match his combination of athleticism, velocity, and starter projection. While he spent 2026 operating primarily as UCLA's closer, the underlying traits suggest a pitcher capable of handling a much larger role moving forward. His ranking reflects both the present quality of the repertoire and the upside if the command holds up over additional innings.

The slider is the carrying pitch and the primary reason Hawk projects comfortably beyond the bullpen. Thrown in the mid-80s with quality depth and late finish, the offering consistently generated swing-and-miss while functioning as his preferred finishing weapon. The ability to locate it down and glove side against right-handed hitters gave him a true out pitch, and the shape showed plus stuff. Even in a class loaded with high-end breaking balls, Hawk's slider remains one of the better pure bat-missing offerings. The fastballs provide the ceiling. Sitting in the mid-to-upper 90s and touching triple digits, the pitch combines above-average ride, meaningful arm-side movement, and excellent extension. Unlike many power relievers, Hawk does not rely exclusively on velocity to generate results. The movement profile forces hitters to account for multiple planes, while the sinker gives him another look against right-handed hitters. The emergence of a promising changeup during 2026 further strengthened the starter projection and gave him another answer against opposite-handed hitters.

What separates Hawk from some of the pitchers ranked below him is the combination of present stuff and future role potential. The command remains imperfect and there is still uncertainty surrounding a transition into the rotation, but few pitchers possess a fastball-slider combination this powerful while simultaneously offering enough supporting pitches to remain a starter candidate.

Why #11: Hawk earns this ranking because of premium stuff, athleticism, and starter upside. Several pitchers below him have cleaner present profiles, but few possess the same combination of velocity, breaking-ball quality, and long-term ceiling. If the rotation transition succeeds, he has the tools to climb significantly higher by draft day.

Number 10: Jackson Barberi, Florida

2026 Stats: 3.13 ERA | 37.1 IP | 1.018 WHIP | 55 K | 17 BB

Best Pitch: Fastball (60/70)

Barberi earns a spot on this list because few right-handed pitchers in the class possess a louder combination of velocity and bat-missing ability. The profile is built around one of the best fastball-slider pairings in amateur baseball, giving him a legitimate professional floor even if the long-term starter projection never fully materializes. While most of his collegiate success has come in relief, the quality of the raw stuff keeps the door open for a larger role moving forward.

The fastball is the centerpiece of the profile. Sitting 97-99 mph and reaching triple digits, it combines elite ride, premium spin, and enough movement diversity to generate swing-and-miss against hitters from both sides of the plate. The pitch consistently dominates above the belt, where opponents struggle to make any meaningful contact. Even with some command inconsistency, the underlying traits are those of a professional-quality fastball capable of carrying an arsenal.

The slider further elevates the profile. Already projected as a plus offering, it gives Barberi a legitimate out pitch and a second weapon capable of generating whiffs independent of the fastball. The ability to throw it down and away to right-handed hitters while also back-footing and backdooring left-handed hitters creates unusual versatility for a pitcher whose reputation is built primarily on power.

What keeps Barberi from climbing higher is role certainty. Unlike several pitchers ranked above him, he has not yet demonstrated that he can handle a starter's workload over a full season, and the changeup remains more projection than present weapon. The raw ingredients are there, but there is still a meaningful difference between a dominant collegiate fireman and a professional starter.

Why #10: Barberi earns this ranking because premium velocity remains one of the hardest traits to find, and few pitchers in the class pair it with a legitimate plus breaking ball. The pitchers ranked above him present cleaner starter projections or more complete arsenals, but very few can match the sheer power of Barberi's profile.

Number 9: Sean Jenkins, East Carolina

2026 Stats: 2.61 ERA | 41.1 IP | 1.137 WHIP | 54 K | 12 BB

Best Pitch: Slider (60/60+)

Jenkins earns a spot in the top ten because few right-handed pitchers in the class possess a clearer professional identity. While the profile is currently built around a multi-inning relief role, the combination of a dominant sinker-slider pairing, elite velocity, and surprising durability creates a realistic path toward significant professional value.

The slider is the centerpiece of the arsenal and the primary reason he ranks here. Thrown at 88-89 mph and reaching 92, the pitch operates in a velocity band rarely seen for collegiate breaking balls. The shape is that of a true power gyro, pairing late depth with enough glove-side movement to avoid becoming a simple bullet slider. More importantly, Jenkins consistently showed the ability to locate it in competitive areas. The pitch served as his preferred put-away offering against right-handed hitters while also showing enough command to be backdoored or buried against left-handed opponents. The combination of velocity, shape, and command gives it true impact potential. The sinker elevates the profile even further. Generating over 17 inches of arm-side movement while sitting in the mid-90s, it consistently produced weak contact, ground balls, and uncomfortable swings. Together, the sinker and slider form one of the better two-pitch combinations in the class and explain much of Jenkins' success despite working almost exclusively out of the bullpen.

What keeps Jenkins from climbing higher is role certainty. Several pitchers ranked above him possess clearer starter projections, deeper repertoires, or a more established path toward turning over professional lineups multiple times. The splitter remains a developmental pitch, and its progress will likely determine whether the profile remains bullpen-oriented or grows into something larger.

Why #9: Jenkins ranks here because of elite pitch quality. The sinker-slider combination is already strong, and few pitchers in the class can match the combination of velocity, movement, and contact suppression. The pitchers ranked above him offer more complete starter profiles, but Jenkins possesses the type of arsenal capable of impacting a professional bullpen very quickly.

Number 8: Will Sanford, Oregon

2026 Stats: 3.74 ERA | 84.1 IP | 1.221 WHIP | 126 K | 46 BB

Best Pitch: Fastball (60/70)

Sanford earns this placement because he possesses one of the most unique fastball-driven starter profiles in the class. While several pitchers ranked ahead of him feature deeper arsenals or greater present certainty, very few can match the combination of carry, angle, and swing-and-miss generated by Sanford's heater. The profile is built around a dominant fastball-curveball combination that consistently created uncomfortable at-bats throughout 2026 while maintaining a starter's workload.

The fastball is the driving force behind everything Sanford does. With 21.5 inches of induced vertical break, a -3.89° VAA, and 6.5 feet of extension, the pitch generates one of the most unusual combinations of carry and angle in college baseball. Hitters consistently struggled to match plane with the pitch, particularly when it was elevated. The ability to miss bats above the zone while still stealing strikes lower in the zone creates two distinct looks from a single offering and helps explain why the pitch generated 134 total whiffs during the season.

The curveball further elevates the profile. Already established as one of the best breaking balls in the class, it gives Sanford a true put-away weapon and creates enormous movement separation from the fastball. Together, the two pitches form one of the strongest primary combinations in the entire draft class. While the slider and changeup remain less developed, both flash enough quality to remain viable long-term supporting offerings.

What prevents Sanford from climbing higher is command consistency. The strikeout totals and pure stuff are undeniable, but the walks remain a significant factor. Several pitchers ranked ahead of him show a stronger ability to consistently turn elite traits into efficient outings. Sanford's ceiling is arguably comparable to anyone on this list, but the present risk profile is slightly greater.

Why #8: Sanford ranks here because of one of the best fastball-curveball combinations in amateur baseball. The pitchers ranked above him offer either more complete repertoires, greater role certainty, or a stronger blend of command and pitchability, but few right-handed pitchers in the class possess the same combination of swing-and-miss and frontline upside.

Number 7: Duke Stone, Mississippi State

2026 Stats: 5.31 ERA | 79.2 IP | 1.469 WHIP | 107 K | 29 BB

Best Pitch: Curveball (55/60)

Stone earns this ranking because he possesses one of the more complete starter foundations among the right-handed pitchers in the class. Standing 6-foot-5 with a four-pitch mix, elite extension, and a pair of legitimate bat-missing secondaries, he already checks many of the boxes professional organizations look for in a starter. While the overall performance was inconsistent at times, the profile consistently flashed the ingredients of a pitcher capable of handling a professional rotation role.

The curveball is the carrying pitch and one of the better breaking balls in the class. Spinning north of 2,700 RPM with steep downward action, the offering generated a 50% whiff rate and nearly a 20% swinging-strike rate while serving as Stone's primary put-away weapon. He showed the ability to both land the pitch early in counts and bury it beneath the zone once ahead. The shape works exceptionally well off the fastball, creating a dramatic change in movement plane that hitters consistently struggled to handle.

The fastball further strengthens the overall projection. Averaging 93-95 mph with 19 inches of ride and seven feet of extension, Stone possesses one of the better pure fastball shapes among starters in the class. The raw characteristics already fit a professional profile, and the strikeout production reflects that. The next step is refining location consistency and reducing the number of pitches that drift back into damage areas.

What separates Stone from several of the pitchers ranked below him is repertoire completeness. The splitter already flashes as another above-average offering, while the slider gives him a different breaking-ball look capable of handling opposite-handed hitters. There is no true weakness in the pitch mix, and multiple routes exist for the profile to take another step forward.

Why #7: Stone ranks this highly because of the combination of starter traits, arsenal depth, and physical projection. The pitchers ranked above him either possess louder present tools or stronger track records of execution, but few right-handed pitchers in the class offer a more complete foundation for future professional success.

Number 6: Wylan Moss, UCLA

2026 Stats: 2.49 ERA | 65.0 IP | 1.046 WHIP | 76 K | 25 BB

Best Pitch: Changeup (60/70)

Moss ranks this highly because he possesses one of the most unique carrying pitches in the entire draft class. Moss built his profile around a changeup that consistently generated uncomfortable swing decisions and allowed the rest of the arsenal to play up. The result was a highly successful 2026 season despite operating with a largely two-pitch foundation.

The changeup is the centerpiece of the profile and one of the best offspeed pitches in college baseball. Featuring substantial velocity separation, extreme arm-side movement, and uncommon carry for a changeup, the pitch creates a movement profile that few hitters are accustomed to seeing. The offering routinely worked down and away to both handedness groups, producing a .157 batting average allowed and a 35% put-away rate. When located properly, it functioned as a true professional out pitch capable of generating both chase and weak contact.

The fastball provides an excellent complement. Moss combines above-average velocity, significant arm-side movement, and nearly seven feet of extension to create a heater that consistently plays above its radar-gun reading. The pitch's shape forces hitters to respect the upper portion of the strike zone, making the changeup even more difficult to identify and handle. Together, the fastball and changeup form one of the better two-pitch combinations in the class.

What keeps Moss from climbing higher is the state of the supporting arsenal. The slider currently functions more as a show-me pitch than a true weapon, while the sweeper remains largely developmental. The path toward a higher ranking is fairly straightforward: establish a reliable third pitch and continue building confidence in a fourth offering. If that happens, the profile becomes much easier to project over a professional starter's workload.

Why #6: Moss earns this ranking because elite changeups are difficult to find, and he is among the best in the class. The pitchers ranked above him either possess more complete arsenals or greater starter certainty, but few right-handed pitchers can match the combination of deception, movement, and bat-missing ability provided by his changeup.

Number 5: Aidan King, Florida

2026 Stats: 3.21 ERA | 87.0 IP | 1.034 WHIP | 92 K | 19 BB

Best Pitch: Fastball (50/55+)

King earns this ranking because he possesses one of the cleanest starter profiles in the class. While several pitchers below him feature louder individual tools, few combine workload, command, athleticism, and arsenal depth as effectively. Across nearly 90 innings in the SEC, King consistently demonstrated the ability to fill the strike zone, navigate lineups multiple times, and generate quality results without relying on a single dominant pitch.

The fastball serves as the foundation of the profile. Thrown from an unusually low release height for a right-hander, the pitch combines above-average ride and meaningful arm-side movement to create uncomfortable angles throughout the strike zone. Further, King showed advanced command, particularly when elevating against lefties while expanding to the edges against right-handed hitters. The raw swing-and-miss rates are solid rather than exceptional, but the combination of shape, command, and deception allows the pitch to consistently outperform its radar-gun reading.

What separates King from many of the arms ranked below him is the depth of the arsenal. The cutter, slider, and splitter all project as viable professional offerings and give him multiple answers against both handedness groups. None of the secondaries currently profile as a dominant out pitch, but all three are functional weapons that prevent hitters from keying on any single movement profile. The splitter, in particular, has the potential to become a defining offering as it continues to develop.

The profile lacks the pure explosiveness of the pitchers ranked above him, but it compensates through polish and versatility. King already carries a starter's workload, throws quality strikes, and already possesses four pitches capable of contributing at the professional level. Those traits provide a strong floor and one of the cleaner pathways toward a long-term rotation role.

Why #5: King ranks this highly because he combines starter certainty, command, workload, and arsenal depth better than almost anyone in the class. The pitchers ranked above him offer louder carrying tools or greater overall ceiling, but few right-handed pitchers possess a more complete foundation for professional starting pitching than Aidan King.

Number 4: Ryan McPherson, Mississippi State

2026 Stats: 3.56 ERA | 43.0 IP | 1.163 WHIP | 51 K | 13 BB | 3.92 K:BB

Best Pitch: Splitter (55/60)

McPherson earns this ranking because of the balance he brings to the mound. Few pitchers in the class combine present performance, athleticism, and arsenal depth as effectively. The Mississippi State right-hander already possesses a starter-caliber five-pitch mix built around a quality fastball and one of the better splitters in the country. While several pitchers ranked nearby possess louder individual tools, McPherson's overall profile offers one of the cleaner paths toward remaining in a rotation.

The splitter is the defining secondary and the pitch that ultimately separates him from much of the field. Thrown at nearly 89 mph with exceptionally low spin, it mirrors the fastball long enough to force commitment before disappearing beneath barrels. The pitch consistently generated chase against both right-handed and left-handed hitters while also producing weak contact when opponents stayed on it. Unlike many collegiate splitters, McPherson routinely located the pitch in competitive areas rather than relying solely on chase beneath the zone.

The fastball provides a strong foundation and creates the environment that allows the splitter to thrive. Sitting in the mid-to-upper 90s with riding life and enough arm-side movement to avoid becoming purely vertical, the pitch gives hitters a difficult look at the top of the zone while forcing them to respect velocity early in counts. Combined with the splitter, it forms one of the better fastball-offspeed pairings in the class.

What ultimately elevates the profile is the lack of obvious holes. The cutter, curveball, and slider all provide distinct movement profiles and ensure hitters cannot lock onto one shape or velocity band. None need to become dominant offerings for the profile to succeed, but all contribute to a repertoire that already looks the part of a professional starter.

Why #4: McPherson ranks this highly because of arsenal completeness, starter traits, and one of the best splitters in the class. The pitchers ranked above him possess either louder overall stuff or greater present impact, but few right-handed arms offer the same combination of floor, projection, and professional rotation value.

Number 3: Sam Cozart, Texas

2026 Stats: 1.72 ERA | 52.1 IP | 0.726 WHIP | 77 K | 13 BB | 5.92 K:BB

Best Pitch: Fastball (60/70)

Cozart ranks this highly because few pitchers in the class combine present performance, arsenal quality, and role projection as effectively. Despite spending 2026 in the bullpen, he looked overqualified for the role at times, consistently dominating high-leverage situations while showcasing one of the deepest repertoires in amateur baseball. The profile already carries the floor of a high-leverage reliever, but the long-term value comes from the possibility that he develops into a professional starter.

The fastball is the foundation. Already one of the best heaters in the class, the pitch generated a 38.7% whiff rate and 19.1% swinging-strike rate while allowing just eight hits all season. The combination of ride, extension, and strike throwing gives Cozart a true carrying pitch capable of overwhelming hitters even when they know it is coming. Few pitchers in the country demonstrated more confidence attacking the strike zone with a fastball in important moments.

What separates Cozart from several pitchers ranked below him is the quality of the supporting arsenal. The slider already projects as a professional out pitch, the sweeper provides another distinct breaking-ball look, and both the curveball and splitter flash enough quality to remain relevant parts of a starter's mix. The result is a repertoire that already looks capable of handling multiple trips through a lineup if given the opportunity.

The remaining question is workload rather than stuff. Cozart has already proven he can dominate in short bursts. The next step is showing that the same command, velocity, and pitch quality hold up over a full starter's workload. If they do, the ceiling rises considerably.

Why #3: Cozart earns this ranking because of the combination of elite present stuff, exceptional 2026 performance, and a realistic starter projection. The two pitchers ranked above him offer more certainty in a full-time starting role, but few arms in the class possess the same blend of upside and present effectiveness.

Number 2: Chris Levonas, Wake Forest

2026 Stats: 2.82 ERA | 73.1 IP | 1.050 WHIP | 116 K | 33 BB | 3.52 K:BB

Best Pitch: Slider (65/70)

Levonas ranks this highly because he possesses one of the cleanest starter profiles in the class. Unlike many high-end college arms that are carried by one dominant pitch, Levonas attacks hitters with a true five-pitch mix that lacks a glaring weakness. The combination of workload, strikeout production, pitch diversity, and command gives him one of the highest floors among right-handed pitchers entering 2027.

The slider is the premier weapon and the pitch that separates him from most of the class. Thrown in the mid-80s with substantial glove-side movement and late finish, it consistently generated swing-and-miss against both right-handed and left-handed hitters. More importantly, Levonas is comfortable using it in any count and to either handedness, giving the pitch true starter utility rather than functioning strictly as a put-away offering. Few breaking balls in the country produced a better combination of whiffs, swings-and-misses, and strikeout conversion.

The rest of the arsenal only strengthens the profile. The fastball provides a quality foundation, averaging 97 mph while consistently working to the edges of the strike zone. The cutter and curveball both project as above-average offerings, while the changeup gives him a viable answer against opposite-handed hitters. There simply are not many college pitchers capable of carrying four pitches graded 55 or better.

What ultimately elevates Levonas is the completeness of the package. He possesses starter velocity, starter command, starter durability, and a repertoire capable of handling hitters multiple times through an order. There may be pitchers with louder individual tools, but very few combine present performance and long-term projection as effectively as Levonas.

Why #2: Levonas earns this ranking because of repertoire depth, command, and one of the safest starter projections in the class. The pitcher ranked ahead of him possesses slightly more pure upside, but no right-hander in the country combines floor, arsenal completeness, and professional starter traits more effectively than Levonas.

Number 1: Dax Whitney, Oregon State

2026 Stats: 2.00 ERA | 63.0 IP | 0.952 WHIP | 104 K | 18 BB | 5.78 K:BB

Best Pitch: Fastball (65/70)

Whitney claims the top spot because he combines elite stuff, high-end production, and one of the most complete arsenals in the class. Few pitchers entering 2027 can match his combination of velocity, bat-missing ability, and starter projection. While several arms on this list possess individual pitches that rival Whitney's best offerings, no pitcher blends present performance and pure stuff more effectively.

The fastball and slider form one of the best primary pitch combinations in amateur baseball. The heater sits comfortably in the upper-90s with exceptional carry through the zone, while the slider already projects as a legitimate professional out pitch. Together they give Whitney two weapons capable of generating swings and misses against hitters from either side of the plate. More importantly, both pitches already perform at a level that supports professional starter projections.

What separates Whitney from the rest of the class is arsenal depth. The curveball provides a drastically different look than the slider, creating an additional movement plane for hitters to account for, while the changeup has developed into a legitimate fourth weapon. Unlike many power arms who rely heavily on one or two dominant pitches, Whitney consistently generated swing-and-miss throughout the arsenal. Few pitchers in the country can attack hitters in as many different ways.

The profile is not without questions. Maintaining health and carrying the same level of stuff over a full starter's workload remain important checkpoints moving forward. Even so, the foundation is already in place. The combination of plus velocity, multiple bat-missing secondaries, athleticism, and strike throwing ability gives him arguably the highest ceiling in the class.

Why #1: Whitney earns the top ranking because he possesses the strongest combination of present stuff, projection, and professional starter traits in the 2027 class. The pitchers ranked behind him each offer compelling arguments, but no arm combines elite pitch quality, arsenal depth, and long-term upside more completely than Dax Whitney.

Conclusion

What makes the right-handed side of the 2027 class so impressive is not simply the number of quality pitchers. It is how many legitimate professional starters exist before the board begins to noticeably thin.

Across the 38 right-handed pitchers evaluated for this project, I handed out 89 future grades of 50 or better, an average of more than two major league average-or-better pitches per pitcher. The group contains multiple pitchers with true top-of-the-draft aspirations, several more with realistic mid-rotation projections, and an unusually large collection of arms who already possess professional-quality fastballs, breaking balls, or offspeed offerings.

The concentration of talent at the top is particularly striking. Dax Whitney, Chris Levonas, Sam Cozart, and Ryan McPherson each possess realistic pathways toward becoming early-round selections while arriving there through completely different methods. Behind them sits another tier of pitchers such as Aidan King, Wylan Moss, Duke Stone, and Will Sanford, who would likely receive considerably more attention in a weaker draft cycle.

Just as impressive is the overall quality of the carrying tools. The class contains multiple fastballs graded 60 or better, several professional out pitches already capable of generating elite swing-and-miss, and enough arsenal depth to support a remarkable number of starter projections. In many draft classes, finding a pitcher with three professional-quality offerings is notable. In the 2027 class, it often feels like the baseline requirement for inclusion among the top names.

The ultimate legacy of this group will not be determined until several years from now. Some pitchers will add velocity, others will refine command, and several names currently outside this list will inevitably emerge. What is already clear, however, is that the right-handed pitching talent available in the 2027 class is exceptional. The stars are obvious, the depth is substantial, and the number of realistic professional starters is difficult to ignore. If the class ultimately reaches its potential, it may be remembered as one of the strongest collections of collegiate right-handed pitching in recent years.
