Write-up

Alivo was a top two way player prospect out of high school that looked the part of a top of the rotation starter in his debut in 2026 earning a rotation spot against top ranked UCLA and excelling in the Big10 tournament against Michigan State. Showcasing 7 pitches throughout the year emphasizes how raw the profile is with it often being hard to distinguish between the breakers. There is risk of RP due to lack of feel on all pitches and no true offspeed but with more innings under his belt, Alivo can end up as one of the top arms in the '27 class.

FB is incredibly firm with his average FB velo ranking in the 97th percentile of velo according to 643. Has average ride/run characteristics but with plus extension and below average release height showed above average carry into the zone. Has a tendency to come out with slight cut. The FB dominated the big 10 competition with a 27.5% whiff rate but the command left something to be desired with a 37.4% zone rate but a lack of spot trends being more middle of zone pulling down the current value.

50/60 pitch

SI is a stock pronator runner 2sm that provides a different look off the FB. Alivo showcased better feel for the pitch than the FB even if it was used sparingly, putting it arm side consistently to both lefties and righties. Struggled to create depth with only 6 inches of IVB difference despite dropping arm slightly to get to SI shape but the ASR difference creates a good tunnel. 45/45 pitch

CT is a gyro SL with elite spin and holds velo off of FB. Gets to depth on occasion with consistent gloveside break. Showed command to both halves of the plate locating armside to LHH and gloveside to RHH. Was an elite CS pitch generating a 44.4% CSW with only 1 whiff on the season (3.7% SWSTR). Operates as more of a bridge pitch to the other breakers. 45/45 pitch

CB has plus 2 plane movement with big tilt that also plays to plus depth with its high spin and plus VAA into the bottom of the zone. There is a big velo range as the shape often backs up into the SWP and SL ranges but when at its best is an elite breaker with demonstrated ability to keep beneath the belt. 55/60 pitch

SL has average gloveside but plus depth getting consistently below the 0 and playing to depth off of release point. Command was inconsistent and represents one of the larger gaps in Alivo's development with SLs blending with CT/CB/SWP shapes and being hung up in the zone. 40/50 pitch

SWP has plus gloveside and above avg depth while holding velo against CT despite the bigger shape. Holds plus spin and gets D/A to RHH exceptionally well and throws it in the zone. To LHH, will backdoor for CS, showcasing a weapon v LHH even if only in 3.5% usage. Failed to get whiff throughout the year but the traits behind the pitch are above average. 50/55 pitch

CH is a poor pitch with high spin for a CH and only slight ASR with poor depth. Lacks big velo separation from either FB without much movement difference as well. Lack of zone feel as well with 21.1% zone and only 1 whiff on the season. Development point is working on a new CH with a possible split grip working to kill velo. 30/30 pitch
