Write-up

Bagwell is a lanky RHH that transferred to the Wake Forest lab this year and took on the Sunday role for most of the year, culminating in getting the ball for the elimination game against Binghamton in the Morgantown Regional. He looks to return in 2027 slotted behind ace Chris Levonas in the Deacons rotation. The cutter /changeup heavy profile plays well in college but represents massive RP risk in pro ball if the FB does not develop. The CT/CH give a solid floor as a RP but right now he's a 4/5 starter.

FB has below average ride with average run often drifting into the "deadzone territory" especially considering how high his release is. Comes in steep to the zone as a by-product of this high release low ride combo. This led to a ~30% fly balls and an 11.1% barrel rate contributing to a .368 average against with .596 slg. There may be room to emphasize gaining run in his FB orientation or finding more ride because at this stage, the FB is not working even as he commands it well to the top of the zone. 30/35 pitch

CT is the carrying pitch in the arsenal but struggled to generate whiff in 2026 while not operating as a damage suppressor. The CT itself is stock shape which will play to slight depth due to high release point. In 2025 at UNC Wilmington the pitch allowed a sub .200 avg but that jumped to .338 this year in the ACC. Throws MOZ to LHH but excels at getting gloveside to RHH. 45/50 pitch

CB is a shorter 12-6 pitch with below average gloveside and average to below average depth. Pitch plays heavy to the bottom third with the high release but the metric depth is not there. The gloveside is also inconsistent, a trait that follows in his slider as well. Shown command to the bottom of the zone to both sides and gets chased beneath to both. I would like to see more depth in development as the pitch has above average spin. 40/45 pitch

SL has sweeper traits at times but is inconsistent in both depth and sweep. It was his least used pitch in 2026 and could be turned into a full sweeper going forward which would give a good break from the heavy north south profile of the CT/CB. 35/45 pitch

CH has elite depth with hard and late tumble while holding plus velo. Showcased exceptional command of the pitch down and armside to both sides. Even when up, the pitch got good contact results with a 52% GB rate and 83 average EV coupled with a 31% whiff rate. Used as his primary pitch to left in 2026 at 29% as part of a 4 pitch random number generator approach to get lefties out. One of the best traits to the CH is that it generated a 58.5% swing rate, showcasing its ability to disguise as the FB and get chased (47.9%) beneath the zone. 55/55 pitch.
