Write-up

A crafty lefty with a high $\frac{3}{4}$ arm slot and cross fire delivery, Barrett struggled in 2026 after a solid freshman campaign, bucking the trend of walk prone ASU lefties turning into aces. Barrett walked more batters than he punched out in 2026 despite being unhittable when he was in the zone allowing only 6 XBH across his 20.1 innings and a .241 BAA across the season. The arm action could also be slightly cleaned up as he is stabby in the back half of his arm swing. If Barrett cannot get through the command problems he is destined to be a reliever but with some command he could develop into a viable lefty long relief option as none of the secondaries clipped that zone at a rate higher than 27%.

The FB is an interesting pitch that leans to cut over run along with slight ride that is the foundation of the profile for Barrett. He threw it over 60% of the time in 2026 to elite results: a .179 BAA/.256 SLG. On the flip side, his command was miss-or-middle and he failed to get substantial whiff garnering only a 6.6% SWSTR. The big extension (nearly 7 feet from a 6 foot frame) help the velo and FB play up which was the key to limiting damage in 2026, but too many FB's leaked to the middle for the success to be sustainable. Shifting his location from down middle to up middle where he got his whiffs would improve confidence in long term success. 40/45 pitch

The CB is sharp despite below average velo and gets plus horizontal due to the slight cross fire delivery. For the velo, there is very little pop out of the hand and Barrett is consistent at getting the ball down. Unfortunately, the pitch only got a 11.9% chase and 0 whiffs in the zone. The pitch generated most of

its called strikes when Barrett was willing to land it near the top of the zone, stealing strikes against hitters. Still, the pitch will need to garner a few more whiffs to develop into a plus offering. It was also his best secondary for zone feel at 26.3%, which still might not cut it long term. 40/40 pitch

The SL holds lift and gets plus glove side, mirroring the CB as an above 0-line complement. He struggles to throw the SL for strikes but when around the zone it got a 29% chase and a massive 57.1% whiff (8 total whiffs, 21.1% SWSTR). This slider shows promise if he can get it a little firmer, as the 11 mph gap is large and likely part of the reason the pitch struggles to find the zone at times. The pitch could benefit from another tick or two of velocity, allowing it to better bridge the gap between the fastball and breaking ball shapes while maintaining its exceptional sweep. He is best at locating down and glove side to both hands. The low zone rate can present itself as more of a feature than a bug in the profile if he continues to locate it well. The shape has big upside if he can hold the command and throw it a tick or two harder as it creates a massive horizontal angle to the plate. 40/50 pitch

The CH once again represents a misleadingly low zone rate pitch as most of Barrett's CH were thrown right beneath the zone and were chased 26% of the time on a 43% swing rate. The pitch has good fade and depth and plays plus when down. It has the highest damage pitch in 2026 with a .714 BAA but the shape and location suggest better results to come. There is room to grow in throwing it to lefties and generating slightly more arm side which drags the evaluation down a bit. 35/40 pitch
