## Write-up

Baumlner profiles as a hard pronator with a ride FB and developing breaking balls and some feel for a CH. The baseline is there with a good frame but he fails to get down the mound proportionally to his height. Righties can often succeed with a FB/CH combo when they flash a slider but it is hard to be a FB/SL guy without a CH in a bulk role. He was moved to the pen as a long reliever and that looks like where he will reside long term until a second offspeed takes a step up against lefties. Unfortunately, he also struggled to get righties out allowing a .340 avg and .526 slg. The framework is there but to be a top pick in '27 he will need to refine the offspeeds throughout the season.

FB is a plus ride pitch from a near OT angle but maintains good traits. Baumlner consistently puts it in the upper third of the zone mainly being armside up in the zone. The FB plays true to its shape due to the lack of plus extension and high release. It got swings but failed to get elite whiff with a sub 10% SWSTR but that may be due to lack of protection from the secondaries. This is a squarely average college pitch that fails to get results due to over use. 40/45 pitch

The CB is a straight downer CB with late bite and very little gloveside. Often leaks into the "deathball" shape but will get over 5 inches of glove. It wasn't consistently down in the zone to righties which led to some damage but when buried it got roughly 40% whiff. It plays steep for its raw IVB due to the high release and gets hitters over the top of it consistently. With growth in command this pitch could jump into the plus tier quickly. 50/55

The SL got Baumler into trouble in 2026 with a .344 avg against and below average bat missing qualities (9.8% SWSTR). The 42% zone rate is also deceiving, throwing a great deal of sliders over the heart of the plate, failing to get the ball down. It seems he almost treated it as a cutter but with below average CT velo, it just spins up there for a hanging SL. When down the pitch flashed good depth but in the zone it was a bullet without depth and flat. Another concern is the 10 degree arm angle drop suggests he slightly tipped the pitch in order to get across the ball. The command and release will need to be cleaned up in 2027 in order to justify the 26% usage and 30% against RHH going forward. 35/45 pitch

The CH is a pretty stock pronator CH that he excels at throwing arm side and down. He throws it firm and arm side which tend to lead to good results, but unfortunately lefties hit .267 against it with a .533 slg (4/15 with all hits for extra bases). This gives Baumler a good floor with the CH that the other secondaries don't show. Lefties whiffed 29% of the time against the pitch. The lack of a glove side pitch was a negative on the CH as 80% of pitches to LHH were working away, letting them set their sights easier. Unfortunately, the arm drop concern is also there on the change. 40/50 pitch
