Write-Up

Bowie is a power lefty with a high-effort delivery and possesses a deep, fastball-dominant arsenal that shows real swing-and-miss traits but has yet to stabilize in the zone. The strikeout ability is present, but the command volatility (32 BB in under 40 IP) drives the inconsistency and keeps him from stacking quality outings. It's a profile that flashes impact stuff in bursts but too often leaks innings via free passes and pitch inefficiency. Quick mover and gets deep into his legs lowering his release height to nearly a foot below his listed. He profiles as an octane LHRP in a high leverage role, leveraging his ability to spin the ball to get outs vs all types of hitters.

The FB may look poor with low ride and below avg ASR but the low release is conducive to an elite -3.86 VAA at the top of the zone and the pitch topped out at 100.3. The command is scattered and looks like he should be aiming middle and letting the pitch drift up. He successfully gets the ball up to lefties but throws it down to right. This profile works to college bats where he got a lot of takes beneath the belt but pro batters swing at low fastballs and punish them. The pitch is clearly plus with a 12% SWSTR and 34% whiff but could take the step into elite with consistent command. 60/60+

SI is the primary pitch to lefties and he excelled at getting the SI to the bottom of the zone, almost down and in to LHH. It allowed a .067 avg to LHH with 35.7% whiff and 81.8% GB. There is real ASR in the profile and this pitch could take a step further in usage to RHH. 60/60 pitch

The CT is more of a pure gyro slider but is incredibly firm and gets to elite gloveside often while playing to the velo. Shown the ability to throw backdoor and down and in to RHH while also throwing low in to LHH. Plays to more depth consistently. May be one of the best pure pitches in the class at getting whiff with 40.4% whiff and 16.6% SWSTR. 70/70 pitch

CB is firm with depth and plus gloveside. Works as a 11-5 pitch (pitcher POV) and is late into the zone with steep and lateral sharpness. The spin sits above 2700 and the velo sits in the 95th percentile for collegiate CBs. Batters swung and missed at a 58% rate with a 22% SWSTR. Hitters only hit .174 against it as well. Command of it is also plus with it down in the zone consistently and just off the plate down. Truly a double plus pitch. 70/70+

The SWP is the least of the breakers but is firm and gets some lateral. Flashed some command D/A to left but struggled often to finish the pitch leaving it up and arm side. The break is late and sharp.

Overall, the pitch isn't needed in the profile but adds a lateral complement to the sinker. 40/45 pitch

The SPL wasn't thrown after April 5th and is a non-factor going forward due to the cutter being more than good enough to get RHH out. 30/30 pitch
