## Write-up

Brassfield is a physically imposing LHP with a big arm and clean mechanics. He creates an interesting angle to the plate with a slight cross fire from a center of the mound set up. He was moved to the bullpen down the stretch for TCU and performed better there than his early struggles in the rotation. The struggle seemed to come against RHH where Brassfield will need to find an out pitch to reach the ceiling his trio of above average pitches suggest. He looks to rebound in 2027 as a cog in a Horned Frog rotation that looks to rebound from a below average 2026 season.

The FB is firm from the left side, sitting at about 93 topping out at 96 with average ride and a tendency to cut away from lefties. The OT angle suppresses approach but with the cross fire high slot delivery creates a plus angle to the plate. He succeeded at throwing down and away to lefties all year garnering a 31% whiff rate. The pitch succeeded at getting whiffs D/A and up above the zone showcasing the bat missing ability the pitch possesses. The problem is when batters made contact, they hit .354 with consistent hard contact. To righties in particular, he allowed a .380 avg and .580 slg with a 51% hard hit rate. The problem seems to be miss-or-middle profile to righties with the pitch either being over the heart or up and away. The pitch presents as below average due to slight command troubles but with the angle and slight cut, it projects as a plus pitch. 45/55 pitch

The SI holds the same velo as the FB but gets to depth and plus ASR. Counterintuitively, the SI was not used to lefties this year but was his second most used pitch to RHH where it allowed a .400 avg but

a 60% GB rate and .467 slg. Once again, the lack of command pulled a lot of the pitches over the heart of the plate as opposed to getting on the outer third. He also drops his arm down to get to the SI about 10 degrees (about 2 inches down and 2 inches out). The pitch also drifts into the deadzone on occasion and doesn't get down with run. The feel needs to be improved on the pitch to help get RHH out in 2027. 40/45 pitch

The SL is the primary pitch to righties and has elite depth with plus gloveside and a 96th percentile spin rate. He excels at locating down and in to righties and showed the ability to throw up in the zone as a front hip pitch to lefties. The average shape is gyro adjacent but with the high slot and tilt it performs to a big total shape and has a steep entrance into the zone. He holds the velo on the pitch as well making it play extremely well to lefties. It is a pure plus weapon that also limited damage to RHH with a .250 avg and .346 slg. Continual refinement in burying the pitch to RHH brings this pitch into elite territory. 55/60 pitch

The CH was starkly used to a 4% usage to righties. It had a 5% SWSTR but he succeeded at getting low and away more often than not. This pitch represents the biggest point of emphasis this offseason in finding a way to get RHH out. In its current iteration the pitch is deadzone and too firm but effort will be needed to improve this as a weapon. 30/30 pitch
