Write-Up

Brown enters 2027 as one of the more projection-oriented arms in the class. The sample size remains limited, but the foundation is easy to identify: mid-90s velocity from the left side, multiple breaking ball shapes, and the athleticism required to continue developing as a starter. The current evaluation is driven more by the quality of the arsenal than by workload or statistical performance, though the underlying traits support a significant jump with additional innings.

The FB is the foundation of the profile. Averaging 93.9 mph while touching 96.1, the pitch pairs above-average velocity with nearly 18 inches of induced vertical break. The combination creates quality carry through the strike zone and gives Brown a weapon capable of missing bats against both handedness groups. Despite the limited sample, the pitch generated a 35.7% whiff rate and consistently produced uncomfortable swings when elevated. The velocity, shape, and handedness support an above-average professional projection. 55/60 pitch.

The CB serves as the primary vertical secondary and generated some of the strongest swing-and-miss results in the arsenal. The pitch combines depth with substantial shape separation from the FB and produced a 100% whiff rate in a very limited sample. The workload is far too small for aggressive conclusions, but the movement profile gives Brown a legitimate second breaking-ball look and strengthens the overall starter projection. 45/55 pitch.

The SL is currently the most advanced secondary offering. Brown landed the pitch for strikes consistently, posting a 73.3% zone rate while generating swing-and-miss when located in advantageous

counts. The ability to throw the pitch in the zone separates it from many developing college breaking balls and gives him another reliable option when working ahead. The pitch already demonstrates feel, strike-throwing ability, and enough movement to project at the professional level. 50/55 pitch.

The CH remains largely developmental due to limited usage. The movement profile is encouraging and the velocity separation works well off the FB, but the sample is too small to make a confident projection. Continued incorporation of the pitch into the arsenal would strengthen the long-term starter outlook. 35/45 pitch.
