Write-up

Collera is a long armed right hander with an odd arm action that invokes a bit of Lucas Giolito or Kutter Crawford with a stutter behind the back into a high three-quarter delivery. The stuff is present with a big breaking ball and fade changeup complementing a solid fastball. Collera looks like a true anchor in the Canes rotation next year. Collera suffered a below average 66.5% strand rate in 2026 which was part of the inflated ERA as he only allowed 1 HR per 9 innings. He profiles as a starter at the next level especially due to the pair of plus secondaries.

The FB is the anchor of the arsenal with plus ride and good ASR. From the high slot he creates a steep angle to the plate but the arm action helps the FB play up. The pitch allowed a .286 avg on the season but lacked the bat missing qualities you'd expect from a front line starter with a sub20% whiff rate, and 8% SWSTR. He succeeded at throwing the pitch to his glove side letting his ASR bring the pitch into the zone. The pitch got its few whiffs up and away from both sides, leaning into that will be the next step for the FB development. Further, the shape drifts into deadzone on occasion which could be limiting the current value. This drift is likely part of the reason the whiffs were inconsistent through the season. The lack of whiffs is a mild long-term concern, the underlying traits and shape paired with good glove side command still give the pitch a high chance to play at the next level. 45/50 pitch

The CB was his least used pitch and only got three flips out there. It had good depth and is steep but was a ball all three attempts. 30/30 pitch

The SWP is Collera's best pitch and it got a 35% whiff rate and allowed a .167 avg on the season. The pitch has big depth and glove side movement and he commands it fairly well considering how big of a mover the pitch is. It also got a lot of CS on the season with a 34.9 CSW on an 11.9 SWSTR. The pitch got all of its whiffs down and glove side which is expected considering how big and lateral the pitch is off the FB. The velo band is impressive for getting so much sweep with the pitch topping out at 84.4. Getting an extra tick and bringing the velo ceiling up could make this pitch into a devastator at the next level. There is ability to backdoor to LHH and with its plus depth it should play decently to lefties (.200 avg v LHH in 2026). The pitch is squarely plus and incredibly unique in its combo of steep/sweep. 60/60 pitch

The CH is a fader that Collera occasionally loses the feel for. Most nights can get the CH down where it gets whiffs and manages contact (75% GB when bottom third of the zone). When left up, it breaks early and without much movement and turns into a slow runner up in the zone, falling into the barrel. Overall, the lack of an XBH allowed to a lefty on the season shows the pure upside on the pitch. Using it as the primary secondary to lefties through the season shows good conviction in the pitch to limit lefties. Its 35% whiff and 16% SWSTR accompanied by a 34% chase rate point to continued success of the pitch going forward. Refining the command and keeping the ball down to play off of the FB is the most important step in the CH reaching its potential. 50/55 pitch
