Write-up

Troy Dressler is a long limbed 6-3 with a quick arm and big OT delivery with an impressive ability to get into his legs to get to a lower than average release height for his arm slot. This creates unique angles on the way to the plate for a guy who works from a high angle. Big shoulder tilt helps him get to that high arm angle. He was in and out of the rotation and got the nod for what ended up being the Deacons last game of the season. He looks the part of a solid collegiate starter but the north south profile without a pitch to break it up limits his upside as he struggled to get righties out all season. Figuring out how to get righties out consistently will take him from a RP profile at the next level to a possible 4/5 starter.

The FB has exceptional ride and often gets slight cut when located gloveside. The spin rate is below average but the pitch plays with a good approach angle and gets whiffs at the top of the zone due to the true ride. Righties punished the pitch all year to a .340 avg but there were a fair amount of ground balls and a .472 BABIP which suggests some bad luck on the FB. Unfortunately, the command leaves something to be desired as most FBs were located in the heart with about 35% of pitches located in the heart zone. The pitch will get the results when up, but consistent pitches in the bottom half is what led to damage in 2026. Improving this will take the pitch from average to plus. 45/50+ pitch

The CT shape wise is interesting. It is backed up and has below average cut. In fact, his cuttiest FB had as much cut as his best CT. It plays more as a depth cutter than anything relying on vertical and velo

separation off the FB to get its 11.4 SWSTR. Sitting at 86.5, that gives it about 8 mph of velocity separation along with about a 15 inch IVB gap. He did locate the cutter well, getting it gloveside and getting a lot of CS to lefties due to the depth. It occasionally lacks finish and he throws it above the zone, but generally the command is above average. Perhaps he can hold the shape with more velocity going forward and that would help against RHH who were unfazed by the pitch (.286 avg, 25% whiff rate, 22% barrel). 45/50 pitch

The CB takes on the deathball shape that is incredibly steep for its raw depth and his 6 foot release height. It disguises well with the CT/FB shown by the 41% chase and 20% SWSTR on the season. It also holds velo exceptionally, sitting at 83 mph through the season. The pitch also performed against RHH which highlights how good of stuff it has. The pitch gets negligible glove side but its steep and late break and ability to bury beneath the zone held off what plagued him in 2026. Of course with the cruelty of baseball, lefties hit the pitch to a .308 avg but the 37% whiff showcases its bat missing ability. He left a few up in the zone which is expected but where the damage came from. The pitch is firmly above average. 50/55 pitch

The split gets below average depth but flashed a plus depth/ASR combo at times playing heavy into the bottom of the zone. He struggled to command the pitch to righties at times missing a lot over the middle of the plate but was incredibly consistent down and away to lefties where he got 13 whiffs on the season. Despite this, lefties still hit .353 against the pitch with a 25% barrel rate while righties struggled. Getting a 59% swing and 20% SWSTR through the season is incredibly impressive and showcases bat missing ability and tunnel off the FB. This paradoxical profile gives hope that the pitch ends up as plus. 45/55+ pitch
