Write-up

Guerin is a long levered RHP out of Iowa that gets to a low arm angle with a heavy sinker with plus ASR. Instead of a traditional E/W profile, he pairs that primarily with a gyro slider and the flash of a splitter. He walked too many batters and now has a career 6.5 BB/9 across his first two seasons along with 28 hit batters. Command will always be a problem as the delivery is high effort and his arm is late often and he yanks pitches. He looks like a future reliever even with command uptick.

The sinker is the primary pitch and shows heavy arm-side run with average sink and strong usage, topping out at 97 on the season. It plays best when located down and to the arm side, where it can generate weak contact and ground balls. However, command inconsistency significantly limits its effectiveness. Too many sinkers leak up in the zone or into middle locations, where the pitch flattens and becomes highly hittable. Further, instead of leaning into the ASR against righties and getting under the hands, he consistently throws it to the outer half. With a walk-prone delivery and inconsistent release timing, the pitch is heavily execution-dependent despite solid raw traits. 40/45+ pitch

The slider plays with a gyro-dominant shape and limited horizontal movement but benefits from velocity separation and steep approach angle off the sinker. It functions primarily as a chase and finish pitch rather than a strike-stealing option. When located beneath the zone, it can miss bats, but inconsistent release leads to frequent miss-in-zone results where whiffs were not present. The pitch

shows enough raw shape and firmness to project as a usable MLB breaking ball, though its effectiveness is tied closely to command stability. 40/45+ pitch

The splitter flashes occasional depth and fade but remains inconsistent in both shape and execution.

Usage is limited and the pitch is not yet reliable enough to function as a true third weapon. Most of its value comes in moments where it shows late drop below the zone, but overall command and consistency prevent it from being a trusted option. Continued development would be required for it to become more than a show-me pitch in short relief stints. 35/40 pitch
