Write-up

Sean Jenkins served as a multi-inning reliever for East Carolina in 2026, making all 18 of his appearances out of the bullpen while routinely handling extended outings. He possesses two legitimate plus offerings in a heavy running sinker and a hard gyro slider, giving him a strong foundation as a professional reliever. The ability to maintain both velocity and pitch shape across multiple innings hints at more than a traditional one-inning bullpen role. While the sinker/slider combination alone projects comfortably into late-inning work, continued development of the splitter would give him a legitimate weapon against opposite-handed hitters and could elevate the profile into that of a high-leverage setup arm or multi-inning leverage reliever. The ingredients for an impactful bullpen piece are already present; the third pitch will determine just how high the ceiling climbs.

The FB functioned strictly as a show-me offering in 2026 and was rarely competitive. It flashed above-average carry, but lacked the command or movement profile to consistently miss barrels or generate swing-and-miss. East Carolina largely phased it out in favor of the superior sinker. 30/35 pitch The SI is the primary fastball Jenkins throws and it is a plus one. Getting over 17 inches of ASR and above average depth from his arm angle, the pitch runs late arm-side and still plays steep into the zone while maintaining elite velocity. He can throw it both arm and glove side where it plays with true ASR on either half. The pitch got 54% GBs while not allowing a homer and only an 86.6 EV. Further, when

he threw it with 2K, it got the punchout 35% of the time. The pitch possesses a rare combo of strike getting ability and contact management. 60/60+ pitch

The SL is Jenkins' premier weapon. Thrown at 88-89 mph and touching 92, it is a true power gyro with late depth and above-average gloveside movement for its velocity band. He consistently located it down and gloveside to right-handed hitters while showing the confidence to bury or backdoor it against lefties. There are still occasional middle misses and the rare backed-up slider, but the overall command is comfortably above average. It also managed contact exceptionally, getting more GB than the sinker and a measly 83.4 EV. The combination of premium velocity, shape, and command gives the pitch true impact potential at the professional level. 60/60+ pitch

The SWP is a slower version of the slider that gets to some more gloveside while holding the same depth. I truthfully am unsure if this truly is a different breaking ball or some manipulation of the existing slider, but the velo and shape are still plus. With more usage, this can be an average pitch. He was 4/9 at zoning the pitch and got two bad looking whiffs against RHH. 35/45 pitch

The SPL is a work in progress with poor command and inconsistent shape but the pitch was generally beneath the zone, but it just often floated armside rather than sharply biting down. When down, the pitch showcased the late bite you'd expect from a splitter. If he can command it, it could end up as a weapon to LHH. 30/40 pitch
