Write-up

A physical right hander with plus feel for spin, Mack is one of the better floor picks in this draft. He pounds the zone with his running sinker and gets elite whiff on his slider/cutter combo. He supplements this core trio of pitches with a developing curve and a fade-y changeup that he struggled to command. This three pitch core the the foundation for at least a fourth pitch projects him as a valuable piece for the Tennessee rotation, likely being the full time Friday night starter in 2027. He throws enough strikes right now, but a step forward catapults his ceiling from 5/depth starter to a 3-4 arm.

The SI was the basis of his LHH attack, and his most used pitch overall. He throws it incredibly hard, topping out at 100 and sitting 96, putting Mack in the upper echelon of college hurlers with regard to velo and holds it well through starts. Command is scattered throughout the zone, but he pounds it well, even with a less than desirable amount of middle misses. He lives armside, letting the ASR carry the pitch away from LHH barrels and into the hands of RHH. Finding glove side command would take his SI a step forward, showing the ability to front hip and backdoor the pitch. This would not only make the SI better, but it would also protect his offspeeds even more. 50/55 pitch

The CT is a lifty gyro with plus glove side and below average velo. He spins it incredibly and it has late bite to his glove side when located away. He showed the ability to land glove side down where a pitch of

its shape performs at its best. The pitch killed RHH getting 10 whiffs across 18 pitches. Being able to utilize this pitch more to RHH to get them off the SI/SL combo, up from its 7% usage, helps set the future value for Mack. 45/50 pitch

The CB profiles more as a show-me pitch in its current form, being slow and lower spin with 12-6 movement. It pops up slightly out of hand and he doesn't get enough depth off the slider to be a real separator/whiff pitch right now. With his spin capacity, he should be able to generate a sweepier slurver that could get CS vs LHH and some whiff v right. 40/45 pitch

The SL is a short sweeper that he also spins the world out of, getting 2620 rpm. This spin creates that late vertical bite to accompany the side to side movement he gets. He used the slider more often than the SI against RHH to great success, generating 69 whiffs throughout the season. He dominated D/A to RHH while showing the ability to both back door and back foot to LHH. The depth was inconsistent, occasionally getting behind the ball, but the glove side is real and the pitch is squarely above average. 55/60 pitch.

The CH has some fade and depth but the command of the pitch is below average, struggling to get it down often, missing middle away to LHH. The pitch has a foundation with low spin and ASR/depth off the SI but right now, it'll need to take a command leap to become an above average pitch. Mack is able to kill velo as well without floating it, so there is a skill to build on, but as of now it is a developmental offering. 35/40+ pitch
