### Write-up

Anderson Nance was one of the top arms out of the NC State pen this year and struggled with command but the stuff and making of a plus RP was there. He has a stabby arm behind the back which may have led to some of the command struggles away from both hitters and spiked FBs. He pulls off the mound and flies open at times which need to be ironed out long term with his inconsistent landing point. From the stretch, Nance showed a more controlled delivery with a less stabby arm and more consistent release. Control will need to be ironed out to make it into a pro bullpen long term, but exciting stuff gives intriguing upside.

FB is a straight ride pitch with average arm-side. The ride plays late and bites vertically through the zone with carry at the top. He was able to get some whiff but command struggles and missing over the heart of the plate led to balls put in play. When he got up and away from both sides he found success, but the unrepeatable motion led to heart misses and a 25% barrel rate. Despite the shape, hitters were comfortable taking the pitch above the zone, forcing Nance to come back over the plate more often than desired. The resulting heart-zone misses led to elevated damage despite the quality of the raw traits. The shape is there to be a plus pitch but continued refinement of command is necessary to bring this pitch into the plus category. 45/50+ pitch

The SL is sharp with late break and short. He carries elite velo and NC State classified the pitch as a cutter, though both the movement profile and usage more closely resemble a hard slider. The zone rate

left strike stealing to be desired but he consistently got it gloveside off the plate to righties. He got a 41% whiff rate and 22% SWSTR on the pitch showcasing elite bat missing ability. Nance struggled to get it down to lefties and it got pounded overall. Refining the command and ability to hide the pitch/backdoor it to left would give the grease a meaningful jump. Still, the bat missing ability is a present trait and showcases what the shape brings. 45/50+ pitch

The sweeper has an intriguing shape with above average depth with above average sweep. It got more whiff than the SL at 50% and worked as a weapon to lefties being able to backdoor and drop beneath the hands. It overall showcased late break with hard sweep creating a hard lateral angle. The velo is held well, sitting about 82 and topping out in the mid 80's. He also demonstrated enough feel to occasionally steal strikes at the top of the zone before finishing beneath it with two strikes. 50/55 pitch

The CH is a heavy fade pitch that gets below average depth off the FB but offers enough of a horizontal angle change that it succeeded in 2026. He was able to get it D/A to left consistently, rarely missing over the heart of the plate. It struggled as a finish pitch but threw it with 2K under 15%. Showing the ability to throw it with 2 strikes will be important in his development of the pitch long term. At present, the changeup functions primarily as a bridge pitch against left-handed hitters, disrupting timing more than finishing at-bats. Expanding its two-strike usage would significantly raise both its value and Nance's long-term bullpen ceiling. 45/50+ pitch
