### Write-up

Jack Ohman possesses one of the more interesting pure stuff profiles in the Ivy League. He attacks hitters with a riding fastball that plays from a high release and pairs it with two distinct breaking balls and a splitter that flashes legitimate swing-and-miss traits. While the overall production was uneven in 2026, much of that stemmed from inconsistent command rather than a lack of stuff. He consistently generated whiffs across the arsenal, particularly against right-handed hitters, and the combination of velocity, spin, and movement gives him a foundation that should translate into professional baseball. The biggest step forward will come from improving strike efficiency and simplifying the breaking ball mix. If that happens, Ohman has the ingredients of a quality professional reliever with enough weapons to attack both sides of the plate and a ceiling as a back of the rotation starter.

The fastball is a quality riding offering with above-average carry, solid velocity, and enough arm-side movement to avoid becoming overly one-dimensional. Sitting 94-95 and touching the upper-90s, the pitch plays particularly well at the top of the zone where the flat approach angle and carry produce uncomfortable swings. Despite only a 21% whiff rate, hitters rarely squared it up when elevated, and it generated 30% CSW despite being in the strike zone over 40% of the time. Ohman consistently attacked above the belt, particularly to right-handed hitters, and the pitch plays best when he trusts that north-south approach rather than trying to steal strikes lower in the zone. Continued refinement

of fastball command should allow the velocity and shape to play closer to an above-average professional offering. 50/55 pitch

The curveball is a true top-to-bottom breaker with elite depth and excellent spin characteristics. Averaging nearly 2,850 rpm with over 10 inches of induced drop, it creates a dramatically different look from the slider and gives hitters another velocity band to account for. At present, however, the command lags behind the raw shape. Ohman struggled to consistently land it for strikes and primarily used it as a chase offering beneath the zone. The movement quality is undeniable, but without greater confidence locating it early in counts, it projects more as a change-of-pace pitch than a featured weapon. The raw ingredients suggest there is still untapped value if the feel improves. 40/45 pitch

The slider is the premier breaking ball in the arsenal. Thrown around 87 mph with tight, late depth and modest glove-side movement, it functions more as a hard power slider than a sweeper. The velocity allows the pitch to play aggressively beneath the zone, where hitters consistently expanded. It generated a 46% whiff rate, over 20% swinging-strike rate, and was responsible for the majority of his strikeout production. Ohman showed advanced feel for locating it down and glove-side to right-handed hitters while also demonstrating enough confidence to backfoot it against lefties. The movement profile is consistent and the velocity separates it well from the curveball, giving it legitimate above-average professional projection. 50/55 pitch

The sweeper was used sparingly but presents an intriguing developmental option. Compared to the slider it sacrifices velocity for significantly more horizontal movement while maintaining quality depth. With such limited usage it is difficult to know whether this is a true fourth breaking ball or simply manipulated slider or curveball shape, but the movement characteristics are distinct enough to warrant attention. If incorporated more frequently, it could give Ohman another weapon against right-handed hitters by changing the visual look away from the tighter power slider. For now, it remains a developmental pitch with interesting upside. 30/35 pitch

The splitter quietly rounds out the arsenal and may ultimately become the key to handling left-handed hitters. Thrown at nearly 88 mph with excellent velocity separation from the fastball, the pitch features low spin and late tumble with enough arm-side movement to mirror the fastball before disappearing

beneath barrels. Ohman showed encouraging feel for locating it below the strike zone, particularly against lefties, where it generated chase without needing to live in the zone. The command is still inconsistent, reflected by the low zone rate, but the underlying traits are promising. Continued development of the splitter would give him a legitimate fourth weapon and help complete an already intriguing professional rotation profile. 45/50+ pitch
