Write-up

Rerick is an octane reliever out of the Sooners pen that won the natty this year but unfortunately he only got 2.1 innings as an arm injury ended his season early. He has an octane mix, highlighted by a mid 90s fastball with ride and sharp cutter. The control was poor in the limited sample this season but the arm injury may have been part of that. He is a risk to go back to school for a senior season as he finishes his recovery, but if he gets drafted and recovers well, he possesses legitimate upside due to the plus nature of those two pitches. The arm action is pushy which is a red flag, but with slightly cleaner mechanics, the health should follow along.

The FB has plus ride from his low release leading to plus carry through the zone. Getting below 6 feet from his 6'4" frame is impressive and creates an uncomfortable feeling and angle for hitters. He has slight crossfire in the delivery which gets him throwing from the 3B side a bit, exasperating the angles game he plays. He was able to get the ball down in the zone and generate whiffs up to both hands in the small sample. The pure velocity shape traits make the pitch above average but being more consistent with the command long term will improve the pitch as he becomes more confident working up. 45/50 pitch

The CT is a carry cutter with hard cut. He keeps it glove side well and buries it D/A to RHH. The cut is late and got whiff on the glove side. He lived at the bottom of the zone with the pitch and it got success, not allowing a hit on the cutter. 50/50+ pitch

The SL was thrown twice but showed depth but was slow. He failed to zone the pitch but it got a whiff when it was down beneath the zone. This will be a key developmental pitch going forward to help neutralize LHH. 40/45 pitch
