Write-up

A sinker/cutter right-hander, Schweitzer attacks hitters with angle rather than overpowering velocity. The arsenal is built around two firm offerings that play off one another, pairing a heavy sinker with a hard cutter before mixing in a low-slot sweeper and occasional changeup. While none of the pitches individually profile as dominant, the sequencing and movement differentials allow him to keep hitters off balance and generate weak contact. The biggest hurdle moving forward is finding a consistent bat-missing offering. He lives around the zone, but with average raw velocity and only modest chase rates, hitters often put the ball in play before he can leverage his secondary pitches. The foundation is that of a strike-throwing innings eater or multi-inning reliever, but developing either the sweeper or changeup into a legitimate out pitch would raise the ceiling considerably.

The SI is the backbone of the repertoire, making up nearly half of his pitches. Sitting just under 90 mph, it features modest sink with average arm-side movement and plays primarily because of angle created from his release. Schweitzer did a solid job locating it to both sides of the plate, particularly working down and arm side to right-handed hitters where the pitch generated the majority of its weak contact. The command was generally solid, although he occasionally leaked it back toward the middle of the plate where the modest movement profile left little margin for error. The pitch generated below-average swing-and-miss numbers but consistently produced early-count contact and ground

balls, culminating in a 63% GB rate. Improving the ability to front-hip lefties and consistently work beneath the barrel would allow the sinker to play closer to its movement potential. 45/50 pitch

The CT is his best secondary and pairs naturally with the sinker. Thrown only a tick slower than the sinker, it separates itself through late glove-side movement and additional ride, allowing it to miss barrels despite similar velocity. Schweitzer consistently located the cutter glove side against both handednesses, showing the ability to backdoor lefties while keeping it off the barrel of right-handers. The pitch generated his best combination of swing-and-miss and called strikes while maintaining solid command throughout the season. It is not a true wipeout cutter, but the shape and command give it the traits of an above-average complementary offering capable of stealing strikes early and finishing hitters late. 50/55 pitch

The SWP flashes the highest movement quality in the arsenal, producing well above-average sweep with quality depth. At just under 80 mph, however, the pitch lacks the velocity necessary to consistently fool hitters at higher levels. The shape allows it to disappear beneath right-handed bats and backdoor lefties, but hitters were often comfortable taking it early because of the slower velocity. Schweitzer showed enough feel to consistently land it below the zone for chase, but he rarely trusted it in competitive counts. Adding velocity without sacrificing the exceptional lateral movement would dramatically improve the pitch's effectiveness and give him a true put-away weapon. As it stands, it profiles as an effective change-of-pace breaking ball more than a primary finisher. 45/50 pitch

The CH remains a developmental fourth offering. The pitch features solid velocity separation and low spin while producing enough fade to keep left-handed hitters honest. Schweitzer consistently worked the pitch below the strike zone, particularly against lefties, where it generated some chase despite limited usage. The movement profile is adequate, but the pitch currently lacks enough conviction or usage to consistently disrupt timing. Continuing to develop command while increasing confidence against opposite-handed hitters could allow the changeup to become a useful complement to the sinker. For now, it functions primarily as a show-me pitch within an otherwise sinker/cutter-heavy attack. 40/45 pitch
