Write-up

Walls is a towering right hander that struggled in his first taste of SEC action after being dominant for Hawai'i in 2025. He possesses an interesting fastball and supplements that with a plus sweeper. The profile is limited due to the fastball traits, but if Florida or a pro org can work on a tweak to improve FB shape, he could sky rocket due to one of the most unique release points in college baseball.

The FB is currently the limiting factor in the profile. Averaging 92.7 mph, the pitch generates only modest ride while entering the zone with a steep -5.74° VAA from a release height north of 6.5 feet.

The combination creates a difficult angle but ultimately produces a shape that lacks a standout characteristic. The pitch generated only a 10.9% whiff rate and was hit hard throughout the season, allowing a .329 average and .746 slugging percentage when put in play. The strike-throwing ability is solid with a 50.9% zone rate, but too many fastballs leaked into damage areas. The pitch projects below average at present and will need either a shape adjustment or improved location quality to provide a stronger foundation for the arsenal. 35/40 pitch.

The SWP is the carrying pitch and comfortably the best offering in the arsenal. Featuring over 13 inches of glove side movement with quality depth, the pitch generated a 28.6% whiff rate and 43.4% CSW while serving as nearly half of Walls' attack plan. He consistently demonstrated the ability to land the pitch in the strike zone early before expanding beneath the zone for chase. The shape works particularly well against right-handed hitters and gives him a legitimate bat-missing weapon capable of

generating professional interest on its own. The pitch already projects as an above-average professional breaking ball. 55/60 pitch.

The CH offers the most developmental upside in the arsenal. Thrown with substantial velocity separation and quality movement relative to the FB, the pitch produced a 38.3% whiff rate and 17.0% SwStr rate. The results against right-handed hitters were particularly impressive, generating a 56.2% whiff rate while allowing only a single hit all season. The current usage is limited, and the command remains inconsistent, but the underlying traits suggest the pitch can become a legitimate secondary weapon. Increased usage against left-handed hitters would strengthen the overall starter projection and help diversify the attack away from an overreliance on the sweeper. 45/55 pitch.
