Write-Up

Whritenour possesses one of the more unusual repertoires in the dataset, essentially functioning off a power fastball and power cutter combination. The arsenal is built on velocity, aggression, and swing-and-miss rather than movement diversity, creating a profile that may ultimately fit best in a professional bullpen. The raw stuff is undeniable, however, and the combination of elite velocity and bat-missing ability gives him a compelling professional foundation.

The FB is the carrying pitch. Averaging 97.7 mph and touching 101.1, the pitch combines plus velocity with excellent ride characteristics and a flat -4.44° VAA. The pitch generated a 25.9% whiff rate despite heavy usage and consistently overpowered hitters in the strike zone. The shape allows it to survive throughout the upper half of the zone, while the velocity creates very little margin for error for opposing hitters. The pitch projects comfortably as a major league caliber fastball. 60/70 pitch.

The CT is the separator and arguably the most important pitch in the arsenal. Thrown at 91.5 mph, the pitch bridges the gap between the FB and a traditional breaking ball while generating a 40.8% whiff rate and 20.1% SwStr rate. The velocity allows the pitch to mirror the fastball deep into flight before creating late movement, frequently producing ugly swings. The shape itself is not overwhelming, but the velocity and execution help the offering play well above the raw movement profile. 55/60 pitch.

The CH is mostly developmental at this stage due to extremely limited usage. The movement profile is intriguing and provides needed separation from the power arsenal, though there is not enough data to make an aggressive projection. Increased confidence in the offering would significantly strengthen any future starter projection. 35/45 pitch.
